

Style and Theme

Contents

- **Style**
- **Theme**

What is a Style?

- Collection of attributes that define the visual appearance of a View
- Reduce duplication
- Make code more compact
- Manage visual appearance of many components with one style

Defining Styles

- The XML file resides under res/values/ directory of your project and will have <resources> as the root node which is mandatory for the style file.
- <style> tag is used to define a style.
- Each style is uniquely identified by it's name.
- Style attributes can be set using the <item> tag.

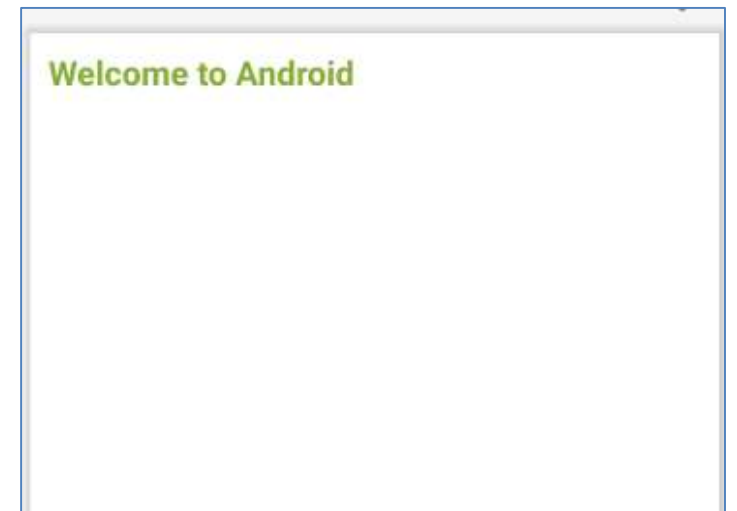

```
<resources>
    <style name="TextviewStyle">
        <item name="android:textColor">#86AD33</item>
        <item name="android:textStyle">bold</item>
        <item name="android:textSize">20sp</item>
        <item name="android:padding">10dp</item>
    </style>
</resources>
```

Using style

```
<TextView
    android:id="@+id/txtResult"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    android:textColor="#86AD33"
    android:textSize="20sp"
    android:padding="10dp"
    android:textStyle="bold" />
```

```
<resources>
    <style name="TextviewStyle">
        <item name="android:textColor">#86AD33</item>
        <item name="android:textStyle">bold</item>
        <item name="android:textSize">20sp</item>
        <item name="android:padding">10dp</item>
    </style>
</resources>
```

```
<TextView
    android:id="@+id/txtResult"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    style="@style/TextviewStyle"
    android:text="Welcome to Android"/>
```

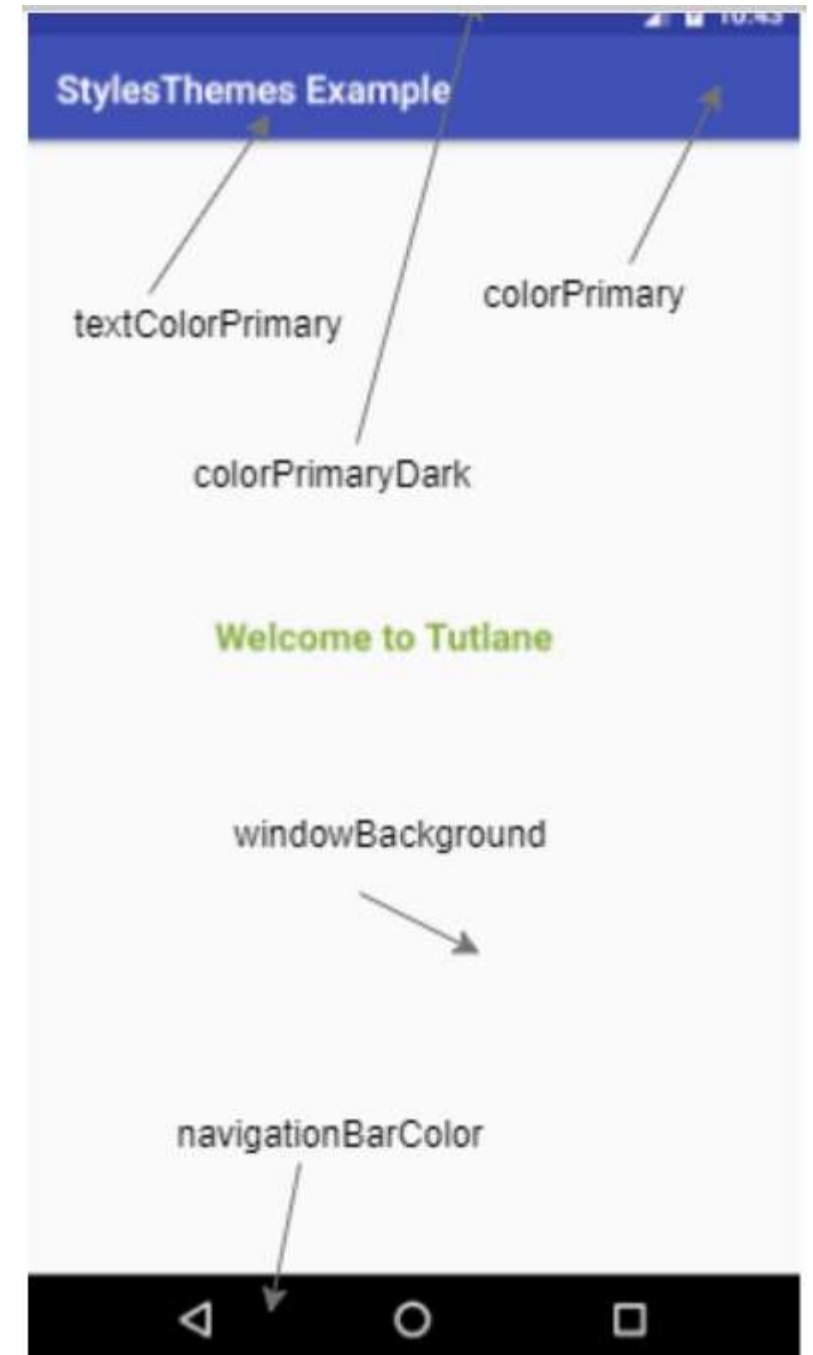

Android Style Inheritance

```
<style name="TextviewStyle" parent="@android:style/Widget.TextView">  
    <item name="android:textColor">#86AD33</item>  
    <item name="android:textStyle">bold</item>  
    <item name="android:textSize">20dp</item>  
</style>
```

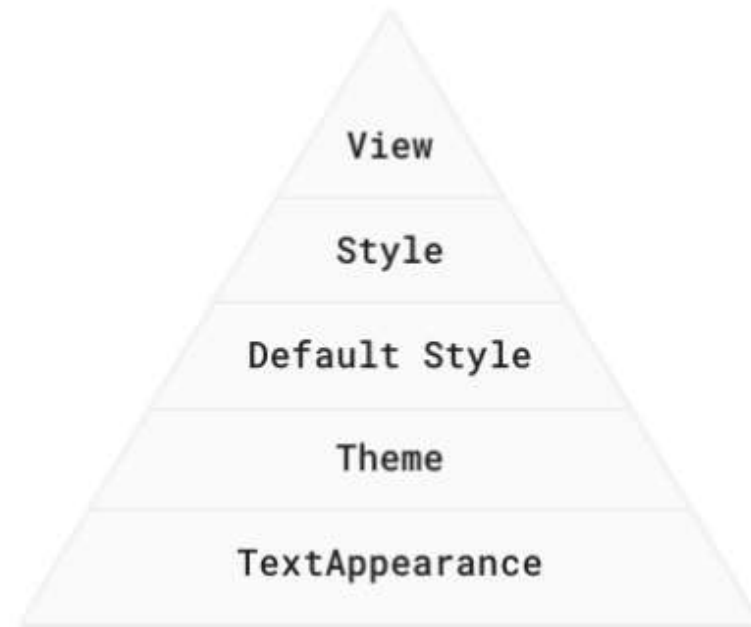

Android Styling Color Palette

- In android, we can customize the application basic theme colors based on our requirements.
- The example of basic material design in the android application

Android's styling system

- The diagram shown below summarizes the precedence of each method of styling
- Priority is top-down

Android's styling system

- **View attributes**
 - Use view attributes to set attributes explicitly for each view. (View attributes are not reusable, as styles are.)
 - You can use every property that can be set via styles or themes.
- **Styles**
 - Use a style to create a collection of reusable styling information, such as font size or colors.
 - Good for declaring small sets of common designs used throughout your app.
- **Default style:** This is the default styling provided by the Android system.
- **Text Appearance:** For styling with text attributes only, such as font family.

Themes

- **A Theme is a style applied to an entire activity or even the entire application**
- **Themes are applied in AndroidManifest.xml**
<application android:theme="@style/AppTheme">

Customize AppTheme of Your Project

```
<!-- Base application theme. -->
<style name="AppTheme"
    parent="Theme.AppCompat.Light.DarkActionBar">
    <!-- Try: Theme.AppCompat.Light.NoActionBar -->
    <!-- Customize your theme here. -->
    <item name="colorPrimary">@color/colorPrimary</item>
    <item name="colorPrimaryDark">@color/colorPrimaryDark</item>
    <item name="colorAccent">@color/colorAccent</item>
</style>
```

Using theme

```
<resources>
```

```
  <style name="AppTheme"
```

```
    parent="Theme.AppCompat.Light.DarkActionBar">
```

```
    <item name="colorPrimary">@color/colorPrimary</item>
```

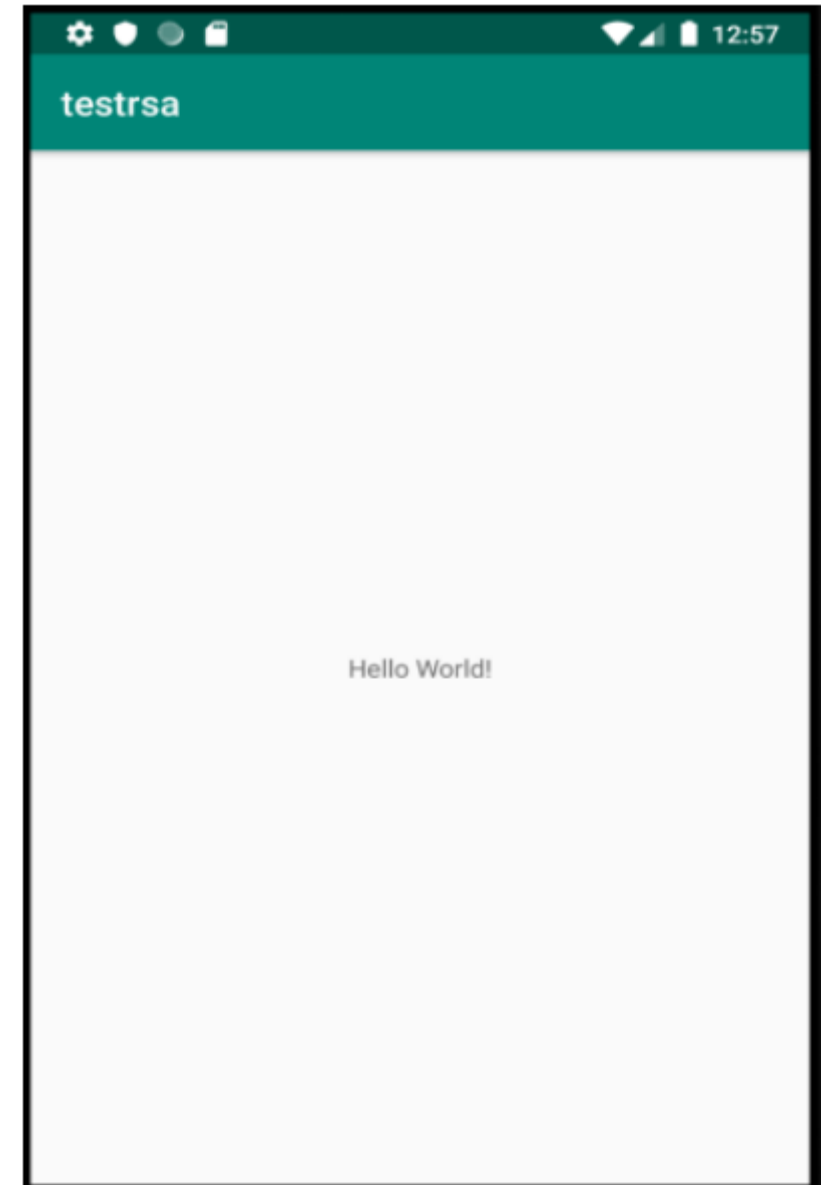

```
    <item name="colorPrimaryDark">@color/colorPrimaryDark
```

```
  </item>
```

```
    <item name="colorAccent">@color/colorAccent</item>
```

```
  </style>
```

```
</resources>
```

Using theme

```
<resources>
```

```
    <style name="AppTheme"
```

```
        parent="Theme.AppCompat.Light.NoActionBar">
```

```
        <item name="colorPrimary">@color/colorPrimary</item>
```

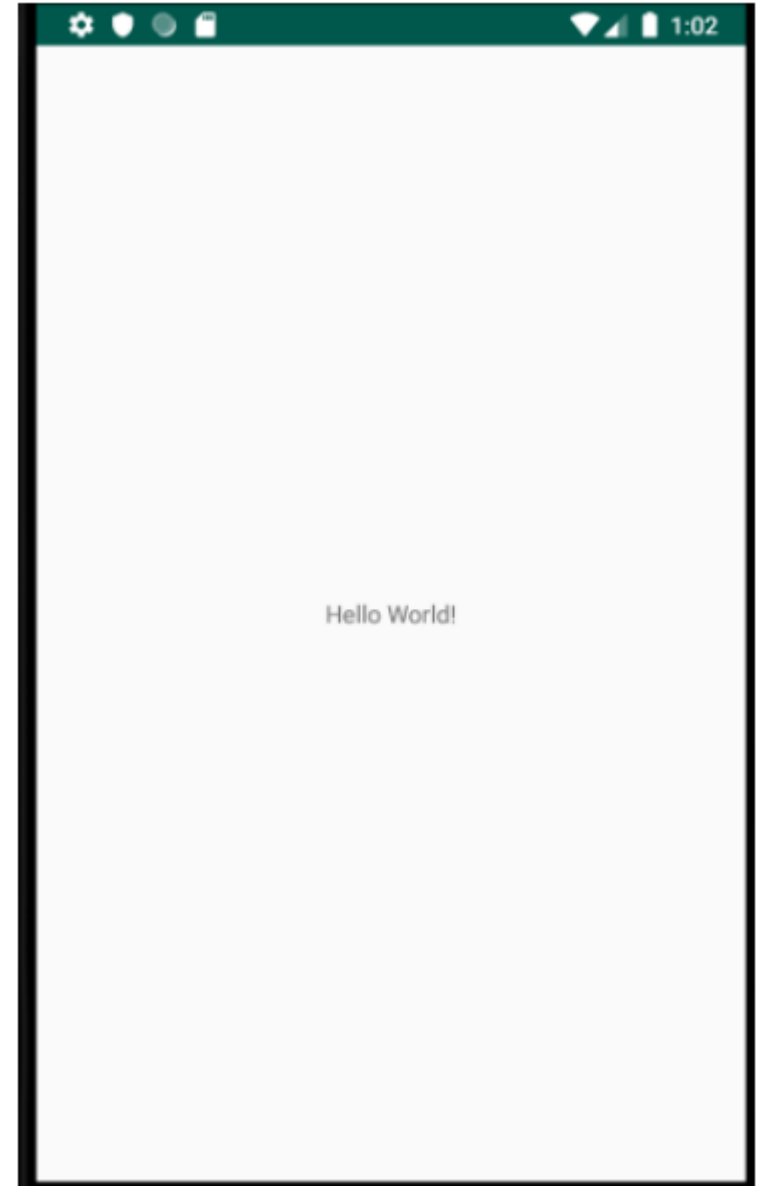

```
        <item name="colorPrimaryDark">@color/colorPrimaryDark
```

```
        </item>
```

```
        <item name="colorAccent">@color/colorAccent</item>
```

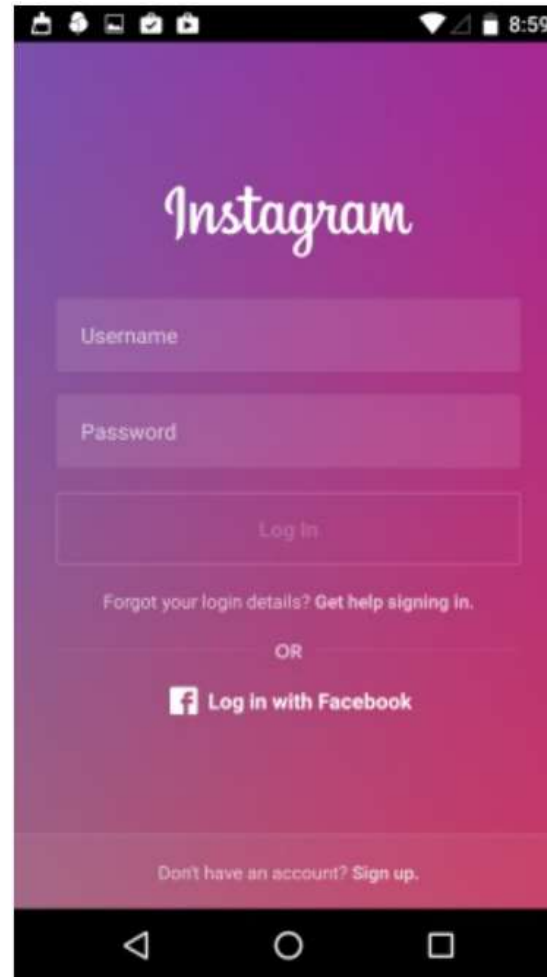

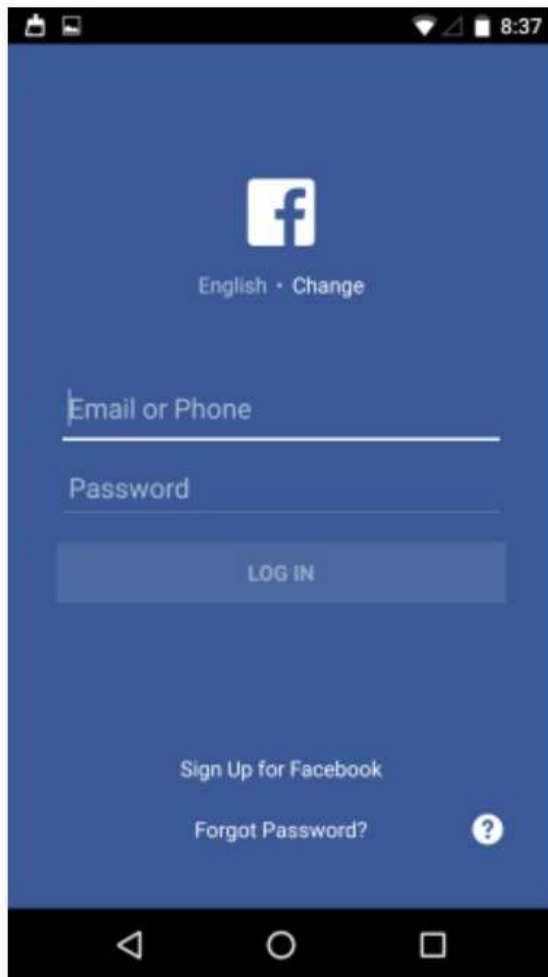

```
    </style>
```

```
</resources>
```

Classwork

- Apply style and theme to Login screens
